

Find the right fit

UBS Equity Income Funds aligning for more volatile markets

Is your portfolio prepared for volatility?

Amid uncertainty over interest rate policy and geopolitical situation globally, investors relying only on standard equity and/or bond investments could experience higher portfolio volatility in a risk-off scenario where sell-off includes both equities and bonds

As a bond investor you should consider

Income from cash and government bonds **is lower than the long-term average** (in some cases sitting in negative territory – e.g. 10 year Swiss or Japanese government bonds)

With bond yields at historic lows and inflation rising, some bonds have **negative real returns**

The **indebtedness** of some countries seems **unsustainable**

Interest rate unlikely to increase significantly in the Eurozone as this would make it hard for certain Euro-zone members to serve their debt

As an equity investor you should consider

Current **equity market environment is challenging and uncertain** with regards to the rhythm at which the Fed will be raising interest rates

Political risk is also high with trade tensions between US and China and possible conflicts in the middle east and the Korean peninsula

Simply buying equities with the highest dividend yield might lead to **"value traps"** because high dividend yield may due to rapidly declining equity prices

Simply buying the broader index might **not yield a high enough yield**

Three sources to generate income

Dividends

Companies around the world have deleveraged their balance sheets and accumulated high cash reserves thanks to increased efficiency and cost consciousness. We can therefore expect them to pay stable or even increased dividends in the future.

Covered call options

The fund sells to an external party the right to buy stocks that it owns, should the stock price reach a pre-defined level (higher than current price). This sale generates a steady flow of income which supports the performance of the fund. In exchange the fund forgo a part of the stock price appreciation on those stocks whose price reaches the pre-defined buy level.

Share buybacks*

Share-buyback is a mechanism for a listed company to return money to shareholders. It uses the profits it makes to buy-back its own shares and this leads to an increase in the share price through the demand it creates for the shares. The volume of share buybacks in the US has risen steadily since 2009.

* Buyback is explicitly taking into consideration for the indicative income yield calculation for US Income given the structurally low dividend yield in the US compared to the rest of the world.

Fitting income sources to your needs

UBS Equity Income Funds aim to reduce portfolio volatility while staying invested

UBS Equity Income Funds

Capture high dividend opportunities

Focus on high quality companies for stability and sustainability of dividends

Aimed at higher income and lower risk than the broader market

Built with defensive nature in mind, in order to reduce volatility of overall portfolio

Call-overlay on most stocks to provide additional income and smoothens portfolio returns

Investment style	quantitative	quantitative	quantitative	fundamental
Income source				

Opportunities

- The funds generate income from different sources: dividend payments, premiums from the sale of call options and share buyback yield (US Income only)
- Companies whose shares are invested in must meet strict quality criteria with regard to their financial situation
- Defensive elements can help cushion price losses during market corrections

Risks

- As the funds invest in equities, major price fluctuations are likely. They are therefore only suitable for investors with an investment horizon of at least five years and a corresponding risk tolerance and capacity
- Because of their defensive elements the funds can lag behind the general equity market development in positive market phases
- The funds use derivatives. They involve additional risks (e.g. counterparty risks)

Glossary

Call option: A call option is an agreement that gives the buyer of this option the right, but not the obligation, to buy a stock, bond, commodity or other instrument at a specified price within a specific time period.

Out of the money (OTM): A call option with a strike price that is higher than the market price of the underlying asset. An out of the money option has no intrinsic value, but only possesses extrinsic or time value.

In the money: In the money means that a call option's strike price is below the market price of the underlying asset. Being in the money does not mean you will profit, it just means the option is worth exercising.

Covered call strategy: Call options are used to generate income through a covered call strategy. This strategy involves owning an underlying stock while at the same time selling a call option, or giving someone else the right to buy your stock. The investor collects the

option premium and hopes the option expires worthless. This strategy generates additional income for the investor but can also limit profit potential if the underlying stock price rises sharply.

Dividend: A dividend is a distribution of a portion of a company's earnings, decided by the board of directors, to a class of its shareholders.

Premia: An option premium is the income received by an investor who sells an option contract to another party.

Maturity: Maturity is the date on which the life of a financial instrument (e.g. an option) ends, after which it must either be renewed or it will cease to exist.

Strike price: A strike price is the price at which a specific derivative contract can be exercised. The term is mostly used to describe stock in which strike prices are fixed in the contract. For call options, the strike price is where the security can be bought (up to the expiration date).
