

# Global Perspectives

Multi Asset | April 30, 2017

## Overview

**Equities:** Global equity markets posted modest gains in local currency terms during April, led by Europe. The gains were driven principally by better than expected corporate earnings and by the perception of reduced geopolitical risks in Europe.

**Fixed income:** Fixed income markets broadly mirrored their equity counterparts during April, with the majority of government bonds posting positive returns. France was the best-performing market. US and European corporate bond yields also fell.

**Currency:** The British pound (GBP) was the standout among major currencies in April, strengthening sharply against the US dollar (USD) as the UK's upcoming general election is expected to give prime minister Theresa May a significantly increased majority and a stronger hand in Brexit negotiations.

## The month in review:

- Global stock markets rallied again in April, continuing the strong start to the year for risk assets. Increased optimism was driven in particular by strong corporate earnings globally and by the victory of pro-European Union candidate Emmanuel Macron in the first round of the French presidential election. UK equities underperformed as the GBP strengthened sharply against the USD after Prime Minister Theresa May announced a snap general election for June 8 in a bid to achieve a strong public mandate as Brexit negotiations begin. Global equities rose despite a mild resurgence of fears over the future path of Chinese growth, as authorities there tighten financial conditions in a bid to clamp down on credit growth.
- The European Central Bank (ECB) surprised markets at its April meeting by maintaining a more dovish tone than had been expected given improving eurozone economic data. The Bank of Japan followed suit by maintaining its current ultra-loose monetary policy amid glimpses of stronger domestic growth but docile inflation.
- In the US, President Trump set the wheels in motion on promised tax reforms as part of his "America First" agenda and imposed higher import levies on Canadian lumber. He also set about reforming the North American Free Trade Agreement (NAFTA), but noted that the US would not be withdrawing from NAFTA "at this time."
- Fixed income yields fell across developed markets as soft economic data in the US reduced the likelihood of interest rate increases from the Federal Reserve. Within credit markets, high yield assets significantly improved after March, with both European and US spreads tightening. In the investment grade (IG) universe, European credit spreads significantly tightened given rising positive sentiment toward the eurozone, with tightening on a lesser scale in both UK and US markets.

## Outlook:

- While the timing and scale of fiscal stimulus in the US still remains uncertain, we believe that the overall demand backdrop in the US is likely to be supported by President Trump's pro-growth agenda, despite some weaker-than-expected short-term data. Globally, we see growing evidence of a broad-based pick-up in European demand growth supported by loose financial conditions.
- In terms of positioning, we do not have strong conviction in the overall direction of global equity markets in aggregate. However, we retain a strong preference for European and emerging market equities relative to the US, based on valuation. In fixed income, however, that preference is reversed as we see nominal US Treasuries offering attractive pick-up relative to other government bonds globally.

## Current views<sup>1</sup>

Asset allocation and currency attractiveness based on fundamental valuation and market behavior analysis

Asset Class	Overall signal	UBS Asset Management's viewpoint
<b>US Equities</b>		<ul style="list-style-type: none"> <li>Our analysis shows the broader US equity market as overvalued in an historical context. The key question is whether the outlook for earnings has increased sufficiently to justify the post-election equity rally. Trailing earnings are no higher than they were two years ago and on a forward-looking basis, we estimate US earnings to be above their cyclically adjusted normal levels. The answer, therefore, would appear to be that US equities are expensive at current levels and with expectations elevated, vulnerable to disappointment. The most obvious source of that disappointment is likely to be President Trump's pro-growth policies as his ability to effect change at the pace and scale already priced into US equities is tempered by a small Senate majority and the realities of Washington dealmaking.</li> </ul>
<b>Global (Ex-US) Equities</b>		<ul style="list-style-type: none"> <li>Outside the US, we see attractive valuations and the improving growth backdrop as supportive to international equities. We continue to believe that the European earnings recovery is gaining momentum. This recovery was initially supported by the ECB's loose monetary policy and a weak euro, but now that bank balance sheet restructuring is largely over, we think it is self-sustainable. Furthermore, we expect the long-term political risk premium reflected in European equities to partially unwind in the coming months. Attractive valuations also support a constructive view of Japanese equities.</li> </ul>
<b>Emerging Markets Equities</b>		<ul style="list-style-type: none"> <li>Emerging market (EM) equities have looked attractively valued on our analysis for some time.</li> <li>We believe that post-US election fears about the impact of a stronger USD and wider trade protectionism risks have been overdone. Thus far, at least, investors' worst fears about Trump's trade policy have not materialized. We see the US dollar (USD) as late cycle and do not believe that a strong USD will derail the improvement in overall demand momentum in EM or the earnings upgrade we have seen.</li> <li>Moreover, we see the potential boost to developed world growth from an increase in infrastructure spending and lower tax rates as positives for demand growth in EM.</li> </ul>
<b>US Bonds</b>		<ul style="list-style-type: none"> <li>On a standalone basis, we see nominal US Treasuries as broadly fair value. Core inflation is edging higher. However, the market's initial expectations on the pace and scale of President Trump's change agenda and its impact on US growth and inflation appear overly optimistic. Moreover, we expect structural deflationary forces including aging populations to continue to act as a rebalancing mechanism to significant yield rises in the medium term.</li> <li>We see nominal US Treasuries as offering attractive carry, particularly versus German bunds.</li> </ul>
<b>Global (Ex-US) Bonds</b>		<ul style="list-style-type: none"> <li>In aggregate, we see global bonds outside of the US as unattractive. German bunds are particularly expensive relative to their long-term history on our analysis.</li> <li>We have a preference for Canadian bonds, which we see as an attractive hedge for lower oil prices given the importance of energy to the Canadian economy. We also believe that the Canadian economy has a long process of restructuring ahead as its reliance on the energy sector diminishes. In our view, the diverging fortunes of provinces make monetary policy very difficult for the Bank of Canada.</li> </ul>
<b>Investment Grade Corporate Debt</b>		<ul style="list-style-type: none"> <li>Our positive view on investment grade (IG) bonds relative to developed world sovereign debt is largely predicated on the former's attractive yield pick-up. We see the global demand for yield continuing to support IG. Given the improving demand backdrop, balance sheet strength and generally loose monetary policy, we think a sharp rise in defaults at the higher-quality end of corporate debt is unlikely. As a result, we see global IG corporates as continuing to offer an attractive risk-and-return profile compared with government bonds.</li> </ul>
<b>High Yield Bonds</b>		<ul style="list-style-type: none"> <li>We see accelerating demand growth and deregulation in the US as positive for corporate cash flows and balance sheets and, therefore, as positive for US High Yield. On a relative basis, we also believe that more domestically biased high yield issuers are greater beneficiaries of the President's pro-growth "America First" agenda than more internationally diverse US investment grade borrowers.</li> </ul>
<b>Emerging Markets Debt</b>		<ul style="list-style-type: none"> <li>We retain a neutral view on external emerging market government bonds. We have a more positive view of local currency EM debt. We believe a subset of currencies within this broad universe now look attractive on a long-term basis, while the improvement in current accounts and broader economic growth now broadly balance the risks from high debt levels.</li> </ul>
US dollar		
Local currency		
<b>Currency</b>		<ul style="list-style-type: none"> <li>Among developed market currencies, we see long-term valuation support for the euro and expect the political risk premium to slowly fade over time. Elsewhere, we view the Swiss franc as among the most expensive currencies globally on our long-term analysis and believe the New Zealand dollar is significantly overvalued in a long-term context.</li> <li>In emerging markets, we retain a constructive view on a number of EM currencies, such as the Indian rupee.</li> </ul>

**Valuations plus one or more market behavior indicators provide an overall signal**

+

=

**Market themes**

Market opportunities that we believe will drive markets in the longer term but have an immediate impact. This helps put valuation into context. For example: "European debt crisis," "aging population" or "deleveraging."

**Momentum and flow**

Attempts to capture money flows and market appetite for risky assets from the perspective of professional asset allocators, such as mutual fund managers.

**Market stress**

We created a proprietary stress index to help gauge price dislocations and investor risk appetite. It comprises several spread measures across credit markets, currencies and cash markets, as well as measures of market sentiment, such as the Chicago Board Options Exchange Market Volatility Index (VIX).

**Macroeconomic landscape**

Understanding the current position (recovery, expansion, slowdown, recession) in the economic cycle of a country or region. We also consider the baseline and alternative economic scenarios of countries and regions and how asset classes may react differently in these scenarios.

**US Equities example as of April 30, 2017**

## Normalized asset class valuations<sup>2</sup>

Normalizing the price/value discrepancy provides a standardized relative comparison across asset classes

<sup>2</sup> Based on UBS Asset Management's views. As of April 30, 2017.

### Definitions of metrics:

- 1. Asset Class/Benchmark:** All investment expectations displayed here are modeled from the discounted cash flows as replicated by the relevant publicly available index. This bears mentioning because these expectations are developed assuming no benefit from active management (i.e. security selection) within the asset classes themselves.
- 2. Price/Value:** An intrinsic value based on the cash flows that an asset class provides—discounted at an appropriate rate of return (the required rate of return)—is identified for each of the asset classes listed. The cash flows would be those that would be expected to pass through to the asset holder; in the case of equities, the relevant cash flows are earnings and non-reinvested earnings (including, though not exclusively, dividends). That intrinsic value is then compared to the market price for the proxy index, and the degree of over- or undervaluation is thereby calculated in percent.
- 3. Normalized Price/Value:** The normalized price/value represents the standard deviation, or dispersion, of the asset class from our estimate of fair value. Normalizing the price/value discrepancy provides a standardized relative comparison across asset classes. The normalized price/value is calculated by taking the price/value of an asset class and dividing it by the secular risk estimate of the same asset class.
