

# Swiss real estate market

## UBS Swiss Real Estate Bubble Index - 2Q 2014

- The *UBS Swiss Real Estate Bubble Index* has risen to 1.24 from 1.22. The regional risk map remains unchanged.
- The risks for the Swiss economy have thus remained virtually constant at a high level for four quarters now.
- The trend towards tighter regulatory requirements for mortgage lending is constricting prices for residential real estate and stifling the outlook.

The *UBS Swiss Real Estate Bubble Index* was practically unchanged in the risk zone, at 1.24 in the second quarter of 2014. Compared to the previous quarter, the index rose slightly by 0.02 points. The risks on the real estate market have therefore not increased significantly for a full year. This is not self-evident, since the market for real estate has so far been outstanding in 2014. The tougher requirements that have so far been imposed on mortgage borrowers and the deposit they need can thus be regarded as a success story: prices for residential real estate rose by just 2% year-on-year despite a friendly macro environment.

Almost all sub-indices rose slightly in the second quarter of 2014. Home prices and outstanding mortgage volumes grew marginally faster than incomes compared to the historical trend. The number of credit applications for properties not intended for owner occupancy weakened. The number of risk regions remained unchanged.

### Methodology

The *UBS Swiss Real Estate Bubble Index* comprises six sub-indices that track: the relationship between purchase and rental prices, the relationship between house prices and household income, the relationship between house prices and inflation, the relationship between mortgage debt and income, the relationship between construction and gross domestic product (GDP) and the proportion of credit applications by UBS clients for residential property not intended for owner occupancy. The *UBS Swiss Real Estate Bubble Index* is calculated as the average of trend-adjusted and standardized indicators weighted using a principal component analysis. The index level shows the deviation in standard deviations from the average, which is normalized to zero.

The index value is categorized into one of five levels: slump (below -1), balance (between -1 and 0), boom (between 0 and 1), risk (between 1 and 2) and bubble (above 2).

## Sub-indices of the *UBS Swiss Real Estate Bubble Index*

### Own home prices relative to annual rent

Purchase prices and rents were in step. The ratio of purchase price-to-rent rose only minimally in the second quarter of 2014 and currently stands at 28.1. This figure is well above the long-term average of about 25.

### Home prices relative to annual rent Level and change year-over-year in percent

Sources: SNB; UBS

### Home prices relative to household income

Home prices rose more than per capita income in the second quarter of 2014. This means that about 6.2 annual household incomes are needed to purchase a home in the medium price segment. In the previous quarter, 6.1 annual household incomes were sufficient. The long-term average lies at 5.2 annual incomes.

### Home prices relative to household income Level and change year-over-year in percent

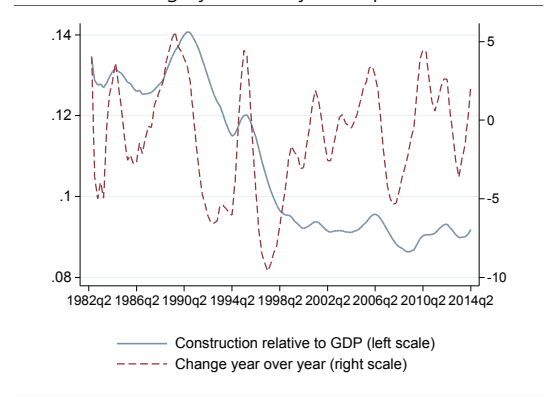

Sources: SNB; BFS; UBS

### Construction relative to gross domestic product (GDP)

The construction industry's contribution to gross domestic product rose further, to 9.2% from 9.1%. The long-term average value lies at 11%. The volume of construction in the second quarter of 2014 grew by nearly 10%, while gross domestic product was only up 1.8%. Given the high levels of construction, the importance of this sector is likely to rise further in the next few quarters.

# Swiss real estate market

## Own home prices relative to consumer prices

Real home prices, as the average value of prices for single-family homes and condominiums, rose 0.4% compared to the previous quarter and barely 2% compared to the previous year. The indicator is still just under 5% below the price peak of the last real estate bubble.

## Home prices relative to consumer prices

Real home prices (CHF/m<sup>2</sup>) and change year-over-year in percent

Sources: SNB; BFS; UBS

## Mortgage volume relative to income

Private household mortgage debt has risen sharply in recent years and is now about 110% of gross domestic product. The 3.5% rise in mortgage volume in the second quarter now lies below the average of previous years. The outstanding mortgage volumes thus grew only marginally faster than incomes compared to the historical trend.

## Mortgage volume relative to income

Mortgage debt of private households relative to income (detrended series) and change year-over-year in percent

Sources: SNB; BFS; UBS

## Credit applications for residential property not intended for owner occupancy (UBS clients)

The number of loan applications for non-owner-occupied properties fell marginally compared to the previous quarter. The indicator has been stagnating at a high level for two years. In the second quarter of 2014, 22% of the credit applications were for properties not intended for self-occupancy.

## Credit applications for residential property not intended for owner occupancy

Share of total and change year-over-year in percent

Source: UBS

## Regions with risk potential for the residential real estate market

The regional risks remain unchanged. Sharp price increases for condominiums of over 4% have been recorded in southern and northwest Switzerland. In the Lake Geneva region and Zurich, on the other hand, prices remain under pressure, which given the high valuation does not indicate a positive shift.

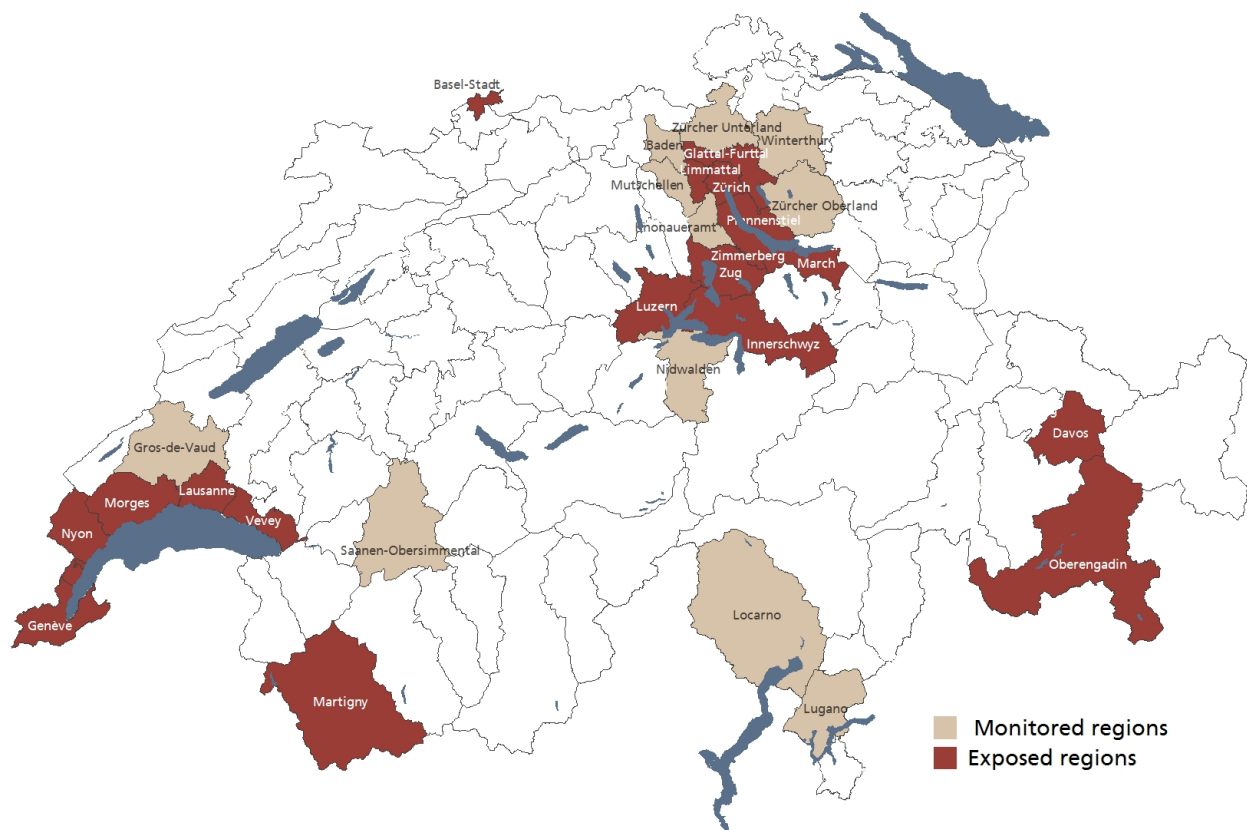

### Methodology

Our selection of exposed regions is tied to the level of the UBS Swiss Real Estate Bubble Index and is based on a multi-level selection process utilizing regional population and property price data (see appendix).

Exposed regions	Monitored regions
Zürich	Knonaueramt
Glattal-Furttal	Zürcher Oberland
Limmattal	Winterthur
Zimmerberg	Zürcher Unterland
Pfannenstiel	Saenen-Obersimmental
Luzern	Nidwalden
Innerschwyz	Baden
March	Mutschellen
Zug	Locarno
Basel-Stadt	Lugano
Davos	Gros-de-Vaud
Oberengadin	
Lausanne	
Morges	
Nyon	
Vevey	
Martigny	
Genève	

### Regional risk map - 2Q 2014

## Appendix: Regional analysis

We utilize an adjusted relative market growth matrix to measure regional risks and risk accruing to the Swiss economy in relation to the situation of the overall market.

First, every region is assigned to one of four categories on the basis of population and population growth (outer matrix):

- *Star Markets* – densely-populated regions with high population growth
- *Developed Markets* – densely populated regions with low population growth
- *Evolving Markets* – small regions with high population growth
- *Marginal Markets* – small regions with low population growth

Secondly, the regions are assigned to one of four further categories (inner matrix), irrespective of their categorization described above, based on price levels and housing price increases:

- *Booming* – expensive regions with above-average price increases
- *Expensive* – expensive regions with below-average price increases
- *Flourishing* – cheap regions with above-average price increases
- *Cheap* – cheap regions with below-average price increases

Thirdly, the relative market growth matrix is linked to the UBS Swiss Real Estate Bubble Index, rendering the selection criteria dependent on the current index level. The higher the index level, the less (relatively) restrictive the selection of regions is.

### Relative market growth matrix

With population and prices as variables

Source: UBS

Example: The upper right quadrant – Star market, booming – contains all regions with both above-average population growth and price increases and that are among the most populated and expensive regions.
