

The merits of multi-factor investing

UBS ETF **On Track Research**

Factor investing has become a mainstream investment approach, with assets in factor ETFs exceeding USD 650bn globally.

Indexed multi-factor portfolios have successfully delivered excess returns vis-à-vis market-cap-weighted portfolios over the long term (historical back-tests), as well as the more recent livetrack period.

Multi-factor exposures tend to deliver return enhancement, whilst limiting the drawdowns and inherent cyclicalities associated with single factors.

Investors are increasingly adopting multi-factor ETFs as part of their core equities allocation. For this purpose, it is advisable to choose a multi-factor exposure that is well diversified and whose active share is not excessive.

Multi-factor investing

Multi-factor solutions provide investors with exposure to well-known equity factors such as Value, Size, Momentum, Quality etc. and therefore have the potential to outperform market-cap-weighted portfolios. They are ideal for investors who want to harvest factor premia in a simple solution, with lower active risk compared to individual factors. Multi-factor solutions also have considerably lower drawdowns and cyclicalities compared to single factors and hence they are more suitable as a replacement of core equity allocations. As a result, demand for multi-factor ETFs continues to grow rapidly. In Q1 2018, they attracted USD 6.5bn globally, nearly 40% of all inflows into factor ETFs.

Our preferred multi-factor solution is based on the MSCI Select Factor Mix Index. It makes equal-weight allocations to six of the most established equity factors: Value, Size, Momentum, Quality, Yield, and Low Volatility (Figure 1). The index is rebalanced quarterly, which strikes a solid balance between turnover and maintaining factor parity, i.e. equal exposure to all six factors. The index follows a top-down allocation to individual factors, often called the “Lego” approach. It combines six individual portfolios,

each of which has a strong exposure to one specific factor. This allows for a straightforward attribution of returns and risks, and for exposure to five or six different factors. An alternative method, called the “soup” approach, aims to select stocks that qualify for several factor criteria at the same time, e.g. Value stocks that also exhibit good Momentum and Quality characteristics. We think this approach works well, but only when combining two or at most three factors. The Lego approach is more suitable for mixing together a higher number of factors.

Track record of outperformance

The popularity of factors stems primarily from their track record of solid returns. The MSCI Select Factor Mix indices have delivered robust outperformance for US, Eurozone, and global developed equities, varying from 140 bps to 220 bps (Figure 2) over the long term since May 2005 (back-test).

The live-track performance of factors is also positive. The MSCI Select Factor Mix methodology was launched on 16 January 2017 for MSCI USA exposure. Since then, it has delivered a 122 bps outperformance against the parent index, which is a solid result given that US markets are deemed to be very efficient. For other regions, the Select Factor Mix indices were only launched recently, but they are based on exactly the same methodology as the US index, so their back-test performance since 16 January 2017 can be considered to be as meaningful as the live-track. Moreover, the six individual factor indices which make up this multi-factor exposure have been live since April 2015. The MSCI EMU Multi-Factor Index delivered an excess return of 187 bps against its parent index since 16 January 2017, while the MSCI World Multi-Factor provided 138 bps of excess return. These results confirm that factor strategies delivered outperformance in the very recent years, such that there can be no concerns of data mining, during a time when factor investing was already in the mainstream.

Summary box

The multi-factor approach has potential to:

1. outperform the market and improve a portfolio's Sharpe ratio
2. limit drawdowns relative to single factors and the market
3. offer transparent return attribution and broadly diversified multi-factor indices that do not carry excessive active shares may be suitable for replacing core equity allocation.

Return attribution

The performance of the MSCI USA Select Factor Mix Index can be clearly attributed to its six constituent single factors (Figure 3). We can see that the MSCI USA Multi-Factor outperformed the market in 12 out of 17 years. The underperformances it showed were relatively marginal at 1 bps, 19 bps, 61 bps, 63 bps and, the largest annual underperformance, 143 bps. In contrast, the outperformances were often much higher, even exceeding 1200 bps in 2001 or 400 bps in 2002, 2004, and 2011. On average, the multi-factor index has provided an excess return of 228 bps per annum since 2001. The figures also show that the chosen single factors have diversifying properties with respect to each other, and incorporating all six factors together

adds value for investors. There has not been a single year when all factors outperformed or underperformed. The mix of factors provided good downside protection during periods of stock market crashes as in 2001 – +12.17% excess return over MSCI USA parent index, 2002 (+5.64%), and 2008 (+3.76%). Hence, in the past, the multi-factor solution not only managed to increase returns, but it also reduced risks. The same results have been observed for the multi-factor indices based on MSCI EMU and MSCI World stock universes.

Figure 3: Excess annual returns of MSCI Select Factor Mix and its constituent factor indices, along with MSCI USA annual return (absolute) for comparison. (TR Net in USD, December '01 – December '17)

Suitable for core replacement

The MSCI Select Factor Mix methodology has several advantages (Figure 4). It provides exposure to the six most established equity factors and uses the Lego approach. This allows for transparent return attribution. The index offers broad exposure to the US stock market, holding on average 1705 stocks over the back-test period. At 39.2%, its active share is not excessive relative to MSCI USA, with 16.6% coming from the small cap exposure alone. This makes the index a suitable choice to replace core equity allocation.

The MSCI Diversified Multiple Factor Index is a competing multi-factor framework that applies the soup approach and optimization-based stock selection with numerous constraints (Figure 4). It includes only 140 stocks and has a very high active share of 83.9%, making it a less suitable choice for core equity allocation.

Figure 4: Comparison of MSCI Select Factor Mix and MSCI Diversified Multiple Factor based on MSCI USA universe

	MSCI Select Factor Mix	MSCI Diversified Multiple-Factor
Idea	Allocates to the six most established equity factors (Value, Size, Momentum, Quality, Yield and Low Volatility). Lego approach rebalanced quarterly.	Seeks exposure to four factors (Value, Momentum, Quality and Size). Soup approach obtained with Barra Equity Model Optimizer. Rebalanced semi-annually.
Weighting / criteria	Weighting = allocate 1/6 th of the portfolio to each single factor.	Weighting = given by Barra optimization to maximize exposure to selected factors subject to numerous constraints (sector active weights, non-targeted factor exposure, turnover, maximum weight multiplier etc.).
Comparison	May be suitable for replacement of the core equity allocation – broad market coverage.	Captures far fewer stocks. Less suitable for core allocation.

Source: MSCI, UBS Asset Management, data as of 30 April 2018.

We can also see that the MSCI USA Select Factor Mix has a better Sharpe ratio, lower maximum drawdown, and less concentration in the top 10 constituents compared to the alternative framework. Additionally, the top 10 constituents of the Select Factor Mix are all stocks with a large market cap, the smallest being IBM Corporation, with a weight of 0.54% in the MSCI USA parent index, and the largest allocation being Apple, which is the same for the MSCI USA (Figure 5). In contrast, the top 10 constituents of MSCI USA Diversified Multiple Factor Index are all companies that are smaller in size and have MSCI USA market cap weights of

between 0.17% to 0.39%, showing that this index is less suitable as a replacement of core equity allocations.

The Select Factor Mix indices based on MSCI EMU and MSCI World have very similar properties as described for the MSCI USA case. In Figure 6 in the appendix, we show comparison tables to the alternative multi-factor methodology and the results are qualitatively the same: the MSCI Select Factor Mix indices are broadly diversified and more suitable for core equity allocation.

Appendix
