

UBS ETF *Market Matters*

Grexit (lessons from the past stress events)

- The economic exposure to Greece amongst Eurozone corporates appears very modest. This suggests limited impact (in the long-run) for the ongoing Eurozone recovery, should a Grexit turn as the outcome. This, however, does not rule out potential of short-term shock.
- We study behaviour of key equity, government and currency benchmarks in view of past stress events. A cross-asset study looks into what one may expect under different stress scenarios.
- Europe-concentrated equity exposure implies weak or zero hedge for Grexit-associated tail risk. Gold (and CHF), as well as short-duration *risk free* fixed income appear to perform well shortly following stress events, and de-correlate from equity.

Pawel Janus, Ph.D.
ETF Strategist, UBS Global Asset Management
pawel.janus@ubs.com

Should the Greek government fail to reach an agreement with its creditors and international partners during the meetings scheduled for the coming days, a further intensification in the crisis seems likely. A vast number of institutions have just published their views on possible scenarios, and their spillover effects. There are generally three scenarios being considered, 1) Greece exits the euro area; 2) capital controls are imposed on Greek banks (incl. changes to the ECB's provision of Emergency Liquidity Assistance), and 3) a last minute agreement is reached in the next days. UBS Wealth Management Chief Investment Office currently assigns 30-40% likelihood of Greece exiting the euro (Source: UBS WM CIO, *Greece: Negotiations move to heads of state*, 19 June 2015). The purpose of this note is to evaluate the economic relevance of Greece based on exposure of various corporate revenues sourced in Greece. In addition, we aim to find patterns in past stress events (those that arrived as *pure* shocks and those that arrived as *anticipated-to-some-degree* shocks). We look into key equity benchmarks, short-duration *risk-free* bonds, and *safe* currencies incl. CHF and Gold.

The importance of Greece (in view of asset valuations)

The market capitalization of the Greek stock exchange has radically shrunk, whilst Greek yields have dramatically increased, in particular in relative terms as seen in **Figure 1**. Markets clearly echo the situation of the Greek economy, continuously deteriorating since 2009, and factor in possible Grexit event. The critical question is whether there will be any spillover effects for non-Greek assets. The answer will depend on how pro-active involvement of the ECB would be. Instead of political considerations, we look first into economic dependence upon Greece. MSCI Economic Exposure Security Data modules provide geographic revenue breakdowns by country and by region for the companies covered by the MSCI All-Country World Index (Source: MSCI Economic Exposure Data Methodology, November 2013). **Figure 2** shows the share of economic exposure of developed markets towards Greece, based on consolidated revenues. Israeli companies, followed by Danish and Belgian companies, source slightly more than 0.5% of their revenue in Greece. In total, Eurozone listed-companies gained approx. 3% of their 2014 revenue in Greece. Emerging market companies appear to be substantially less dependent on Greece, as seen in **Figure 3**. Overall, Greece has modest economic weight in the Eurozone (amongst listed companies), suggesting limited impact (in the long-run) on the ongoing Eurozone recovery should an exit from euro be the final outcome. This, however, does not rule out potential of short-term shock, so we analyse past stress events to better understand spillover effects.

Realized spillovers (lessons from past stress events)

We identified the most important stress events, going back to 2000, see **Table 1**. We study behaviour of main equity benchmarks (in local currency terms), short-duration *risk-free* bond indices (in local currency terms), and safe currencies, CHF and Gold. The time period of about one quarter following the stress event is analysed. The events were ranked from a *pure* shock (like September 11) to *anticipated-to-some-degree* shocks (like Argentina halting payments on its debt in December 2001). In this order (subjective ranking), these are shown in **Figure 4** to **Figure 9**. In addition, we computed the cross-asset unconditional correlation matrix (i.e. using all available data), and *stress* correlation matrix (i.e. using one-quarter data following the event). The correlation matrices are shown in **Table 4** and **Table 5** (post-Lehman case), respectively. The key lessons from the stress events were summarized in **Table 2**, and contrasted with long-run patterns. To summarize, volatility generally increased across all asset classes, and mostly for equity. Depending on the severity of stress event, equity may experience 10-15% of drawdown (e.g. September 11 or USA downgrade). Correlation within equity generally increases, and particularly strongly for related regions (e.g. EMU, UK and Switzerland). Europe-concentrated equity exposure has a weak hedge for Grexit-associated tail risk, whilst broader equity exposure (rather currency hedged due to additional currency volatility) could diversify this risk. Equity risk can be offset with *risk-free* fixed income. The negative correlation between equity and risk-free fixed income strongly upsurges following stress events, i.e. there is a run for the most liquid Treasuries or Bunds. Notably, when reviewing figures showing the behaviour of assets, Gold typically gains in value, at least in the short-run. Similar holds true for CHF, however to a lower degree. These currencies have therefore historically worked as a *tail* hedge. This is confirmed in **Table 3**, which cardinally ranks (from the best to the worst) assets in view of their absolute performance (i.e. with no risk adjustment), over a longer period and following stress events. Gold (and CHF), as well as short-duration *risk free* fixed income performed well shortly following the stress events, whilst equity performed poorly. The longer the period of time following stress event, the more investors turn to a *risk-on* mode.

Table 1: Realized stress events

Terrorist Attack, Sep. 11, 2001	Greek Debt Restructuring, Mar. 9, 2012
Lehman Default, Sep. 15, 2008	Detroit Default, Jul. 18, 2013
SNB CHF/EUR floor removal, Jan. 15, 2015	Argentine Default, Dec 24, 2001
S&P downgrades U.S. credit rating, Aug. 5, 2011

About UBS ETFs

Passive capital investments have been a core competence of UBS Global Asset Management for over 30 years. This business segment, which includes UBS ETFs, has assets under management of GBP 160 billion (March 2015). Assets under management in UBS ETFs total approx. GBP 17.5 billion (May 2014). UBS is one of Europe's leading ETF providers, and Europe's second largest provider of physically replicated ETFs (measured in number of ETFs). UBS ETFs replicates 163 indices covering equities, bonds, precious metals, real estate, commodities and alternative investments. UBS ETFs are listed on four of Europe's leading stock exchanges: Borsa Italiana, the German Stock Exchange (XETRA), the London Stock Exchange (LSE), and the SIX Swiss Exchange.
