A revolution in equity investing

A deeper dive into nonfinancial data
Equity investing and security analysis are undergoing a paradigm shift toward a sharper focus on evaluating intangible assets. In parallel, sustainable investing is transforming from an investment approach heavily reliant on exclusionary screens and haunted by questions about underperformance, toward identifying outperforming companies using an extended mosaic of nonfinancial data. This advanced approach can reveal key insights that traditional equity analysts may overlook. In this paper, we describe the emergence of a globally standardized, objective approach to holistic security analysis along two dimensions: analyzing valuations from financial data, and incorporating nonfinancial (sustainable) data.

**Key points**

- 80% of the market value of S&P 500 firms is generated by intangible assets, including brand, reputation, R&D pipelines, customer satisfaction, health and safety record, environmental performance, and social license to operate, among others.
- In-depth analysis of material nonfinancial data is becoming more critical to assessing the contribution of these intangible assets to firm valuations.
- Sustainable investing is transforming into identifying outperforming companies through the analysis of an extended mosaic of data that incorporates material nonfinancial factors.
The global search for more comprehensive data

Today’s (r)evolution in security analysis can best be understood in the broader context of how firms are valued today. Our understanding and analysis of a firm’s economic value has changed meaningfully in the past 40 years.

In 1975, 83% of a firm’s market value was made up of tangible assets (see Exhibit 1). An equity analyst back then could safely rely on financial statements to estimate value. Today, the situation could not be more different. Indeed, it is the inverse: Only 16% of the market value of the S&P 500 firms is embedded in their tangible assets. The “remaining” 84% is associated with intangible assets.

Identifying and valuing intangible assets, such as brand, reputation, culture, customer satisfaction, human capital, risk management, R&D and a company’s social license to operate, are challenging because they rarely leave a clear imprint in financial statements. They require a fair amount of in-depth qualitative assessment and the application of new fields of academic and financial study, like assessing environmental risks, and evaluating societal externalities, both positive and negative. Today, there is clear evidence that the market considers these intangible assets to be extremely valuable. The challenge has been how to identify and measure nonfinancial factors in ways that are meaningful to equity analysts, and help them predict future business performance.

The search for nonfinancial data has parallels in the difficulty US equity analysts faced 20 years ago when looking for global financial data. Data for companies based in France or Singapore, for example, were not standardized and required extra effort to find, analyze and incorporate into investment decisions. But for analysts who rolled up their sleeves, the rewards were higher returns on an actively managed global equity portfolio. Since then, financial data have been standardized in the International Financial Reporting Standards (IFRS) set by the International Accounting Standards Board (IASB), yielding a more reliable and highly comparable data source on investment companies across the globe. Consequently, investors no longer question whether investing outside of the US is worthwhile. It’s widely accepted today that our investible universe encompasses a global market where companies are influenced by globally interactive factors. This was a fundamental tenet of Gary Brinson’s ‘intrinsic value’ investment philosophy when he founded one of our predecessor firms, and it remains the bedrock of the sustainable equity team’s investment process today.
Nonfinancial data are going through the same evolution and standardization process that has made global financial data so easy to access and use today. Over the past 15 years, the world’s largest corporations have started to voluntarily disclose nonfinancial (sustainability) data on supply chain risks, health and safety records, and environmental pollution, in accordance with guidance from the Global Reporting Initiative (GRI). Today, the GRI lists over 400 indicators on corporate nonfinancial performance. In 2011, the Sustainability Accounting Standards Board (SASB) was launched to identify which environmental, social and governance (ESG) issues are most likely to be material for individual industry sectors. Going forward, the European Union has mandated disclosure of nonfinancial information as of 2017 for all public companies with over 500 employees.

Our central belief is that by considering this new and evolving set of nonfinancial data, equity analysts can deliver a more accurate and comprehensive view of a company’s opportunities and risks. As equity investors, our job is to build the most complete mosaic of data possible to craft an informed opinion of a company’s future growth prospects. For decades, we, like many investors, captured investment opportunities by identifying discrepancies between the price the market places on a security and estimates of long-term value. Today, by incorporating nonfinancial data into security analysis, we believe investors can paint a more accurate picture of a company’s future profitability, identify risks to its value chain, and evaluate its ability to innovate and grow.

The materiality of sustainability data

It’s not hard to grasp that ‘nonfinancial’ sustainability risks can have a real economic impact on companies—sometimes of seismic proportions. When a clothing factory in Bangladesh collapsed in 2013, the negative ripple effects spread quickly across the international apparel industry. Mounting evidence that processed foods contribute to obesity, diabetes and digestive illnesses is forcing a fundamental rethinking in the US food industry. Flooding in Thailand in 2011 caused significant disruptions in chip manufacturers’ supply chains, erasing billions in forecasted revenues. More recently, US national media are rife with reports of water mismanagement in drought-stricken California, after Governor Brown imposed a 25% reduction for urban water use this March. Many believe California’s days as the supplier of almost half of US fruits and vegetables are numbered. According to the World Economic Forum’s annual global risk rankings, water crises, failure to adapt to climate change, extreme weather events, and social instability/inequality have consistently ranked in the top five economic risks, and present a real challenge to corporate executives at global companies.

Numerous studies have shown that information on environmental and social events (e.g., spills, accidents, fines and penalties, boycotts and labor strife) depress stock prices. In fact, research finds that from 1980 to 2009, stock prices dropped an average of 0.65 percent within the two-day window following the release of negative environmental news. For individual companies, these price drops can be quite dramatic. Environmental and social events can slash expected cash flows, and threaten the very survival of a business.
A revolution in equity investing: A deeper dive into nonfinancial data

Shareholders aren’t the only actors driving companies to change. Edward Freedman posited that a broader coalition of ‘stakeholders’ is often the most effective change agent, comprised of employees, customers, suppliers, communities, government bodies, and a range of political and labor groups. These stakeholders typically target large companies in consumer products that are financially sound, but are heavy polluters. Stakeholders often repeatedly pressure an exposed company, especially if it has a strong brand and reputation. Once tainted, companies can become more susceptible to the negative effects of media attention and are more likely to accede to stakeholder demands, even if their sales have not been negatively affected and there is no material cash flow impact. In other words, a targeted company may be compelled to act (e.g., investing in pollution reduction or signing up to an environmental standard) to repair its reputation. When media get involved, the impact is amplified given how humans respond to bad news. A good rule of thumb is that one negative story is the equivalent of five positive stories. For example, stakeholder protests targeting labor (e.g., fair labor practices) or consumer issues (e.g., product safety or performance) with more media coverage tend to have a greater negative effect on stock returns than do boycotts alone. If an equity analyst believes that a company’s economic value remains unimpaired by poor publicity, a price plunge may pose an attractive buying opportunity. Conversely, the disclosure of serious problems that leads to fines, sanctions or lost brand equity may cause real and long-lasting financial damage.

Controlling risks and creating value

No company and no technology is completely risk-free. Whether it is using a new technology, such as driving an electric car, making the car battery that contains heavy metals, or disposing of the toxic plastics in the car at the junk yard—each phase of a green car’s “life-cycle” presents risks to human lives and to the ecosystem. Whether or how these risks are mitigated or exacerbated often depends on the actions or inactions of large corporate entities. For example, years ago the largest producer of chlorofluorocarbons (CFCs)—which destroy the Earth’s protective ozone layer—was DuPont. Once the company agreed to end production of CFCs and shifted to a higher margin substitute of hydrofluorocarbons, governments had a better chance of agreeing to enact the Montreal Protocol in 1989, setting standards to protect the global ozone layer. Decades of scientific discovery have revealed...
that many environmental and health risks are concentrated in a few industries. Coal-fired power, for example, is the biggest source of carbon emissions globally and a significant driver of climate change.11 The (over)use of sugar in food products is closely tied to the global obesity epidemic.12 And in the US, some of the most toxic and carcinogenic chemicals are largely emitted from just two industries: aluminum and cement.13

The take-home from these examples of environmental and health issues is that they can pose a real economic threat to corporations in various industries, jeopardizing the value corporate executives seek to deliver to their shareholders. While some of these risks can be controlled, others (e.g., climate change and demands from customers and local communities) are far more difficult for corporate executives to manage (see Exhibit 2). However, when the evidence of an ESG risk begins to mount, it behooves a company to act and to do so ahead of the issue, and more importantly, ahead of the competition. Smart companies can be strategic in how they mitigate risks. By using a forward-looking strategy that embraces a consistent set of actions, corporate leadership can ensure “that the competitive advantages of activities cumulate and do not erode or cancel themselves out.”14 For example, corporate management can alter product design or production methods to minimize operational and technology risks. However, risks associated with a company’s global supply chain may be harder to manage because they are not directly owned.

Exhibit 2: Controlling sources of risks and value

A revolution in equity investing: A deeper dive into nonfinancial data

Some supply chain risks can actually represent an opportunity and not just a liability, given shareholder and community stakeholder demands. For example, while some apparel companies dropped suppliers that employed child labor, others partnered with their suppliers to keep children in school. This is one of many examples where companies successfully built shared value within their nearby communities. Consideration of these risks (and opportunities) can help a company compete within its industry, creating value not only for its shareholders, but also value for its broader community. Conversely, corporate executives who ignore tangible risks can create uncertainties that eventually threaten cash flows, and drive stock prices down.

Many strategies that corporations use to minimize risks, such as reducing material inputs like water and energy, are consistent with profitable management practices because they lower costs and improve margins (see Exhibit 3). Similarly, in today’s asset-light, knowledge-intensive companies in Silicon Valley, creating an environment that attracts and keeps talented employees is not a luxury; it is an essential component of a highly competitive business strategy. Safe and efficient factories lower insurance costs, create superior working environments and produce higher-quality products that are well-perceived by consumers.

**Analyzing risks and values holistically**

Clearly, a company is more than just the sum of its parts and its balance sheet. As Michael Porter, a leading scholar of competitive strategy, noted back in 1981,¹⁵ the operating environment of a company is highly complex (see Exhibit 4 on the following page). Effectively analyzing a company’s future growth prospects requires an equity analyst to consider

---

**Exhibit 3: Effective company management**

- Company productivity
- Energy Use
- Water Use
- Impact on environment
- Employee skills
- Worker safety
- Employee health
- Supplier access and viability
- Lower costs

---

not only a company’s strengths and weaknesses, and external industry and technological threats, but also its corporate executives’ values and behaviors, and constraints imposed by broader societal expectations. Porter proposed that the goals of a company should encompass both “economic and noneconomic considerations,” such as social obligations, treatment of employees, and the company’s overall organizational climate. Equity analysts and investors ignore this complexity at their own risk.
Research on gold mines helps us understand how a proactive response to what Porter termed “societal expectations” can impact security valuations. It turns out that gold mines with a track record of positive engagement with local community stakeholders enjoy a significantly lower cash flow discount rate at 12% than those with contentious relations (72% discount rate). Why? Regulators and local community activists can inflict crippling production delays if a mine operator ignores them. It turns out that the value of positive relationships was worth twice as much as the gold controlled by the mines.16

Nonfinancial indicators of success are not obvious, and quite hard to find in financial statements. That is precisely why they can be a differentiator for active investment managers that know how to identify and measure them. Many are fundamental factors that help illuminate whether company executives are managing their assets smartly—both tangible and intangible (e.g., physical, intellectual and reputational)—and driving shareholder value upwards. Rather than detracting from returns, security analysis that incorporates nonfinancial sustainability factors and a broader mosaic of data helps equity analysts identify truly competitive business models and companies that can generate attractive financial results. 🕊

Constraints via broad societal expectations

Footnotes

2 The New York Times, December 14, 2011, reported that Intel announced that its fourth-quarter revenue would be $13.4 billion to $14 billion, down from a previous forecast of $14.2 billion to $15.2 billion because of supply shortages of hard disk drives, as a result of flood damage to factories in Thailand. Shares of Intel lost 4% to close at $24.

What sets UBS Asset Management apart

Your global investment challenges answered

An increasingly complex and interconnected world presents investors with many questions, and answers can be hard to find. Drawing on the breadth and depth of our capabilities and our global reach, we turn challenges into opportunities. Together with you, we find the solution that you need.

A leading asset manager

UBS Asset Management, a business division of UBS, is a large-scale asset manager with well-diversified businesses across regions, capabilities, and client segments. Whatever your investment profile or time horizon, we offer a comprehensive range of active and passive investment styles and strategies designed to meet your needs across traditional and alternative asset classes.

Disclosure
